

A B S T R A C T

A KIT FOR IMPLANTING IN A DUCT

5 The kit comprises a tubular endoprosthesis (14) and
a prosthetic valve (16) which comprises a carrier frame
(22) that is radially deformable in elastic manner
relative to a main axis (X-X) between a deployed,
implanted position and a folded, implanting position.
10 The carrier frame (22) is urged elastically towards its
deployed position. A flexible shutter (24) is connected
to the carrier frame (22). It is deformable between an
obstruction position in which it is extended
transversely, and a release position in which it is
15 contracted transversely under the action of the flow
flowing through the carrier frame (22). The frame
includes means (26A, 26B) integrated therein for
centripetally compressing said carrier frame (22) towards
its folded position against the elastic action.
